Using the Cross-National Equivalent Data File Codebook

This codebook includes four components: a list of comparable variables, a description of how they were created, the algorithm used to create each variable from the original panel data, and descriptive statistics. Users who exclusively use the Cross-National Equivalent Data File are encouraged to check the algorithm used to construct the CNEF data. I describe how each variable was created in the section labeled AMethod.® Researchers who wish to link the equivalent data to the original survey data will find the original variable names in the algorithm attached to the descriptive statistics. This algorithm indicates how original variables are used to construct the data in each year. An example of the codebook and its code is given below:

Description This variable represents the labor earnings of each individual in the household.

Method *Description of Variable Creation*

Labor earnings include wages and salary from all employment including training, primary and secondary jobs, and self-employment, plus income from bonuses, overtime, and profit-sharing.

Specifically labor earnings is the sum of income from primary job, secondary job, self-employment, 13th month pay, 14th month pay, Christmas bonus pay, holiday bonus pay, miscellaneous bonus pay, and profit-sharing income.

This variable is current year Deutschmarks.

Variable Name D11101_20LL
 Variable Label Age of Individual
 Survey/Created S
 Reliability 1
 Unit of Observation I

Description Indicates the age of the individual in years.

Method Age at 30 June of interview year, calculated from date of birth. Topcoded above 90 years

Format: .M (-2) = Item non-response
 .S (-3) = Survey non-response
 0 = Newborn up to first birthday
 92 = 90 years old or more

The value of this variable ranges from 0 to 92.

Note that age is imputed for all respondents for which it is missing. Age is topcoded for those 90 years or more old.

Unweighted Statistics

Variable Name	D11105LL
Variable Label	Relationship to Household Head
Survey/Created	C
Reliability	1
Unit of Observation	I

Description This variable indicates the individual's relationship to the current survey year's head of household.

Method

In HILDA household head is not collected. For the purposes of this analysis, a head is assigned for each household as follows: male parent in couple; or single parent; or lone person. (wHHRIH & wHGSEX). The relationship to head is assigned using derived relationship variables of each individual (wRG01 to wRG14) to each other household member. No head has been assigned for households where all members are unrelated or there are only indirect family relationships (wRG01 to wRG14 are only combinations of unrelated or other family member)"

	.S	(-3)	=	Survey non-response
	1		=	Head
	2		=	Partner
	3		=	Child

This algorithm omits individuals with survey non-responses.

Unweighted Statistics

Algorithm:

Head assignment: male parent in couple or single parent or lone person from wHHRIH & wHGSEX. Relationship assigned from wRIH which describes relationship of enumerated person to rest of household.
