
Longitudinal Weights Variable File Index

Release 21: General Release

General Information

This dataset contains many possible combinations of enumerated person and responding person longitudinal weights. Longitudinal weights represent a common group of people over multiple waves. These weights adjust for attrition from the initial wave and are benchmarked back to the key characteristics of the initial wave. For instance if you were interested in a panel of respondents from waves 2 through 7, the weight provided for this panel would adjust for attrition from the balanced panel¹ from wave 2 to 7 and would ensure key characteristics of the wave 2 population are matched.²

The weights provided on this dataset include the balanced panel from every wave to every other wave (for example the balanced panel from waves 2 through 8) as well as the panel for any paired combination of waves (for example, for the panel of people in wave 2 and wave 8).

In previous data releases, only longitudinal weights for the balanced panel from wave 1 to every other wave were provided. These weights are still provided on the relevant datasets, under their old variable names, but have been included here under the new naming convention for completeness.

Replicate weights for each of the longitudinal weights are available on request (email hilda-inquiries@unimelb.edu.au).

Variable naming convention

Two prefixes are used:

- *wle* denotes a longitudinal enumerated person weight; and
- *wlr* denotes a longitudinal responding person weight.

Two types of suffixes are used:

- *t1_m* represents a balanced panel weight from wave *t1* to wave *m*. Wave letters are used in place of *t1* and *m*. A balanced panel weight only includes individuals who have been enumerated/responded (depending on the prefix) in wave *t1*, *m* and all waves in between.
- *t1m* represents a paired longitudinal weight from wave *t1* to wave *m*. Paired longitudinal weights represent all individuals that were enumerated/responded (depending on the prefix) in wave *t1* and *m*. The paired longitudinal weights do not restrict eligible individuals in any way based on their response status in waves between *t1* and *m*.

For example, the variable *wleab* represents the paired longitudinal enumerated person weight for waves 1 to 2 and the variable *wlrc_f* represents the balanced longitudinal enumerated person weight for waves 3 to 6.

The balanced and paired weights for any one wave step (e.g. *wleab* and *wlea_b* or *wlrde* and *wlrd_e*) are identical but have been included to simplify programming for automated systems such as PanelWhiz.

¹ A balanced panel of respondents includes only individuals that were responding or out of scope (dead or overseas) in all relevant waves. A balanced panel of enumerated persons requires the individuals to be enumerated or out of scope in all relevant waves.

² Deaths and people that move overseas also receive a weight.
